

Report on the experiment ME-65 (Part I)

From 23 to 26 February 2000 we collected XAS Spectra at the beamline BM-08 (12 shifts experiment ME-65) on smectite treated with Cu and Cu-amino-acids complexes. The results are very preliminary however we enclosed examples of the spectra to demonstrate that the experiment was carried out successfully. We considered interesting to continued experiment on the pollution of soil minerals to understand local structure of heavy metals in treated smectite.
