

**X-ray diffraction experiment with crystals of FvpA-(Pvd) or (Pvd-metal(Ag, Mn or Ni)) from  
*Pseudomonas aeruginosa*  
Experiment 30-01-838**

Crystals of FpvA from *P. aeruginosa* bound to Pvd, or Pvd-metal were tested on BM30A. Most of them are twinned and diffracted X-ray at 3.5 Angström resolution. No useful dataset was collected. Only 1,5 shift was used due to the beam loss resulting from a piezo defect.
