

Proposal Code EC- 729 on ID22 from 02 Feb 2011 to 05 Feb 2011

Proposal Title

Metallic inclusions in radio-tolerant green micro algae for environmental bioremediation

Experimental Team

- E. Farhi (ILL), C. Rivasseau (CEA/Grenoble), T. Leonardo (ILL/CEA), D. de Gouvion St Cyr (CEA)
- Local Contacts: R. Tucoulou, Peter Cloetens (ESRF/ID22)

Samples (Biological)

Coccomyxa actinabiotis cells grown in metallic solutions (Ag, Co, Fe, Mn, Zn, Ni, U, Cr) cryo-fixed on a silicon nitride membrane (Si₃N₄).

Methodology

Samples have been initially observed using an optical microscope in order to select those alga cells relevant for the nano-fluorescence scanning. The beam size was about 130x100 nm size at 26 keV (Ag-K line).

Results

90 cell images were acquired during the experiment. The metal localisation depend on the oxidation state and toxicity. Most +II metals are distributed inside the cell, with a slight enrichment of the mucilage/membrane.

Illustration 1: Fluorescence spectrum for some regions of an alga cell enriched in a $[Ag^+] = 10^{-5} M$ solution. The vertical lines indicate the energies of fluorescence K and L lines for a number of elements.

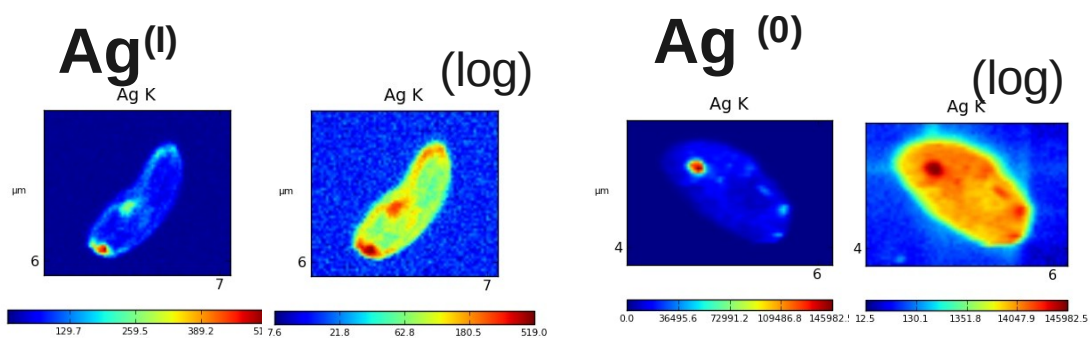

Illustration 2: Fluorescence Ag-K line images for two algae cells exposed to $10^{-6} M$ (left) and $10^{-2} M$ (right) silver solutions. The images are shown in linear and log intensity scale.

Illustration 3: Fluorescence Co Zn and Fe K-lines images for an alga cell exposed to $10^{-5} M$ metallic solution. The images are shown in linear intensity scale.
