

Data bases on SR Beamlines – supply of the “perfect” beam.

- **Who will use the information (users, problem detection, maintenance)? How long does info get stored? Need to transfer between sites? So 1 database or many? Remote or local access?**
- **Don't we all have the same data model?**
- **How to interpret this wealth of info? Any one out there have any tools or do we have to develop them? Rapid and slow timescale.**
- **Validation of data base information? Standardisation? (when is a wavelength not a wavelength?)**
- **Database or header or both?**
